

LESSON 2: Classification

Cost function, Supervised classification, Performance metrics

CARSTEN EIE FRIGAARD

AUTUMN 2022

$$\mathbf{X} = \begin{bmatrix} x_1^{(1)} & x_2^{(1)} & \cdots & x_d^{(1)} \\ x_1^{(2)} & x_2^{(2)} & \cdots & x_d^{(2)} \\ \vdots & & & \vdots \\ x_1^{(n)} & x_2^{(n)} & \cdots & x_d^{(n)} \end{bmatrix} = \begin{bmatrix} (\mathbf{x}^{(1)})^T \\ (\mathbf{x}^{(2)})^T \\ \vdots \\ (\mathbf{x}^{(n)})^T \end{bmatrix}$$

Agenda

Cost Function, Supervised Classification, Performance Metrics

- 1. Admin (afleversformat, grupper, etc.)
- Forelæsning
 - Resumé
 - Lineær algebra og cost funktionen, J
 - Opgave: L02/cost_function.ipynb
 - Fundamental ML supervised lærings-proces,
 - Supervised binær klassifikation
 - Opgave: L02/dummy_classifier.ipynb
 - Scikit-learn fit-predict interface,
 - Scores/Performance metrics
 - Opgave: L02/performance_metrics.ipynb
- 3. Opgaveregning på klassen..

RESUMÉ: The toolset for ML

A list of our toolbox

- **Python**: our prefeered language for ML,
- Anaconda: a particular distibution of python, that we will use,
- Jupyter notebooks: interactive coding and visualization for python (alt: Spider, PyCharm),
- NumPy, SciPy, Pandas, Matplotlib, Seaborn: numerical computation and data visualization libraries for python,
- Scikit-learn: machine learning tools.

RESUMÉ: Jupyter Crash Couse

Jupyter need-to-know:

- Ctrl+Enter: executes cell,
- Shift+Tab: help for function under cusor,
- Shift+Tab repeated: extended help,
- ► Tab: 'tab'-completion??

Jupyter magic commands:

- %matplotlib inline: pull in the matplotlib,
- %reset -f: reset all vars (or -sf),
- %run filename.ipynb; execute code from another notebook or python file,
- %load filename.py: copy contents of the file and paste into the cell,
- ! dir: executes a shell command.

RESUMÉ: Jupyter Crash Course

Jupyter shortcuts:

 To modes: command mode (blue) and edit-mode (green),

```
In [ ]: a=1
```

ESC: goto command mode (from edit mode),

Keyboard shortcuts

The Jupyter Notebook has two different keyboard input modes. **Edit mode** allows you to type code/text into a cell and is indicated by a green cell border. **Command mode** binds the keyboard to notebook level actions and is indicated by a grey cell border with a blue left margin.

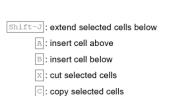

Command Mode (press Esc to enable)

Enter: enter edit mode

Shift-Enter: run cell, select below

Ctrl-Enter: run selected cells

Alt-Enter: run cell, insert below

Shift-V: paste cells above

RESUMÉ: Python Libraries Crash Course

A lot of modules/libraries are available for python, here we will use:

- numpy: numerical data representation module, for say vectors, matrices etc,
- matplotlib: Matplotlib is a Python 2D plotting library which produces publication quality figures.

Other libraries, typically used in ML, are:

- pandas: python data analysis library, a module for loading/saving and handling large data set,
- scipy: python library used for scientific computing and technical computing.

but we try to stick to numpy in this course, ...and note that numpy.matrix is depricated!

RESUMÉ: Matplotlib Crash Course

Visualizations can be created in multiple ways:

- ► matplotlib
- pandas: (via matplotlib),
- seaborn: statistically-focused plotting methods.

And we will stick to matplotlib, don't re-invent the wheel; find demos here

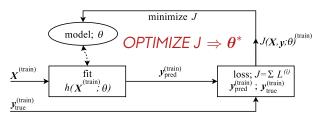

THE COST FUNCTION (LOSS)

$$egin{align} \mathcal{L}_2: & ||\mathbf{x}||_2 = \left(\sum_{i=1}^n |x_i|^2
ight)^{1} \ & \ \mathcal{L}_2^2: & ||\mathbf{x}||_2^2 = \mathbf{x}^{ op}\mathbf{x} \ & \ d(\mathbf{x},\mathbf{y}) & = ||\mathbf{x}-\mathbf{y}||_2 \ & \ \end{aligned}$$

The Cost Function

Data-flow model for supervised learning

X^(train): trænings data input,

loose notation: $\mathbf{X}^{(\text{train})} = \mathbf{X}^{(i)}$ for $\forall i \in \text{train set}$

 θ : model parametre,

h: hypothesis function; types of ML algos,

y^(train): training data output,

y^(train): predicted (train) data output,

 $L^{(i)}$: individual loss (distance),

J: loss/cost/error/objective function (summeret)

Exercise: L02/cost_function.ipynb

The Design Matrix

Say, we have d features for a given sample point. This d-sized feature column vector for a data-sample i is then given by

$$\mathbf{x}^{(i)} = \begin{bmatrix} x_1^{(i)} & x_2^{(i)} & \cdots & x_d^{(i)} \end{bmatrix}^T$$

The full data matrix \mathbf{X} and target column vector \mathbf{y} are then constructed out of n samples of these feature vectors

$$\mathbf{X} = \begin{bmatrix} x_1^{(1)} & x_2^{(1)} & \cdots & x_d^{(1)} \\ x_1^{(2)} & x_2^{(2)} & \cdots & x_d^{(2)} \\ \vdots & & & \vdots \\ x_1^{(n)} & x_2^{(n)} & \cdots & x_d^{(n)} \end{bmatrix} = \begin{bmatrix} (\mathbf{x}^{(1)})^T \\ (\mathbf{x}^{(2)})^T \\ \vdots \\ (\mathbf{x}^{(n)})^T \end{bmatrix}, \quad \mathbf{y} = \begin{bmatrix} y^{(1)} \\ y^{(2)} \\ \vdots \\ y^{(n)} \end{bmatrix}$$

(and **X** and **y** are sometimes concantenated into a single matrix!)

Exercise: L02/cost_function.ipynb

Distance/norms

The \mathcal{L}_2 Euclidian norm for a vector of size n is defined as

$$\mathcal{L}_2: ||\mathbf{x}||_2 = \left(\sum_{i=1}^n |x_i|^2\right)^{1/2}$$

and thus via linear algebra and vector inner-dot product $\mathcal{L}_{2}^{2}: ||\mathbf{x}||_{2}^{2} = \mathbf{x}^{\top}\mathbf{x}$

 $d(\mathbf{x}, \mathbf{y}) = ||\mathbf{x} - \mathbf{y}||_2$

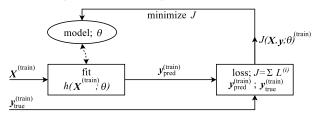

$$= \left(\sum_{i=1}^{n} |x_i - y_i|^2\right)^{1/2}$$
he general \mathcal{L}_n norm is given by

The general \mathcal{L}_{D} norm is given by

$$\mathcal{L}_{p}: \ ||\mathbf{x}||_{p} = \left(\sum_{i} |x_{i}|^{p}\right)^{1/p}; \ \text{norm:} \left\{ \begin{array}{l} \mathcal{L}_{p}(\mathbf{x}) = \mathbf{0}, \ \Rightarrow \mathbf{x} = \mathbf{0} \\ \mathcal{L}_{p}(\mathbf{x} + \mathbf{y}) \leq \mathcal{L}_{p}(\mathbf{x}) + \mathcal{L}_{p}(\mathbf{y}), \\ \text{(triangle inequality)} \\ \mathcal{L}_{p}(\alpha \mathbf{x}) = |\alpha| \mathcal{L}_{p}(\mathbf{x}) \end{array} \right.$$

Exercise: L02/cost_function.ipynb

Data-flow model for supervised learning

Express J in terms of vectors and matrices using the \mathcal{L}_2

$$J(\mathbf{X}, \mathbf{y}_{\text{true}}; \boldsymbol{\theta}) = \frac{1}{n} \sum_{i=1}^{n} L^{(i)}$$

$$= \frac{1}{n} \sum_{i=1}^{n} d(h(\mathbf{X}^{(i)}) - \mathbf{y}_{\text{true}}^{(i)})^{2}$$

$$= \frac{1}{n} ||h(\mathbf{X}) - \mathbf{y}_{\text{true}}||_{2}^{2} \qquad \text{Equation } 2-1. \text{ Root Mean Square Error (RMSE)}$$

$$= \frac{1}{n} ||\mathbf{y}_{\text{pred}} - \mathbf{y}_{\text{true}}||_{2}^{2} \qquad \text{RMSE}(\mathbf{X}, h) = \sqrt{\frac{1}{m} \sum_{i=1}^{m} (h(\mathbf{x}^{(i)}) - \mathbf{y}^{(i)})^{2}}$$

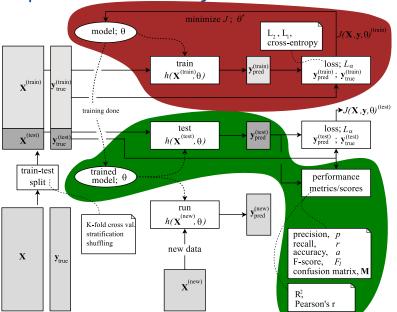

arriving at a J proportional to the MSE or \mathcal{L}_2 metric

cost function:
$$J(\mathbf{X}, \mathbf{y}_{true}; \boldsymbol{\theta}) \propto \frac{1}{2} ||\mathbf{y}_{pred} - \mathbf{y}_{true}||_2^2 \propto \textit{MSE}$$

Fundamental supervised learning-proces

- i) Forbered data:
 - manuel preprocessering + visualisering (støj, outliers..)
 - ▶ label y_{true} data!!!
 - normalization, skalering
 - shuffle,
 - (stratification, K-fold cross-validation).
- ii) **Split** data i train/test.
 - analogi: skriftlig eksamenssæt på ASE: test-træningssæt (eksamen) udleveres ikke til træning inden!
- iii) Træn på trænings-data (fit)
 - ► ML træning via J,
- iv) Evaluér på test-data (predict)
 - performance metrics/scores

ML Supervised Learning, Train/Test (The Map)

CLASSIFICATION

409/12432

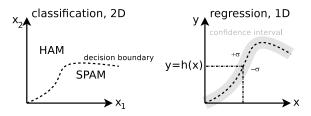

07498**094**

Classification vs. Regression

Given the following hypothesis function

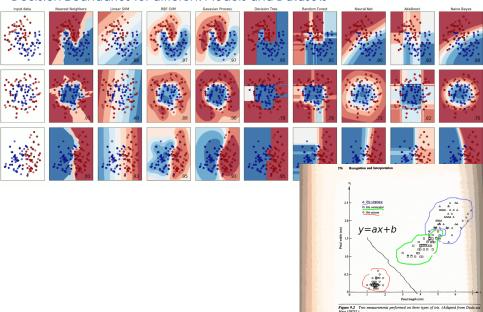

$$h(\mathbf{x}) \rightarrow y$$

- if y is discrete/categorical variable, then this is classification problem.
- if y is real number/continuous, then this is a regression problem.

Classification

Decision Boundaries for different Models and Datasets

Binary Classification

```
5041921314
3536172869
409/124327
3869056076
1819398593
3074980941
4460456700
1716302117
9026783904
6746807831
```

Figure 3-1. A few digits from the MNIST dataset

Training a Binary Classifier

, 10-class to BINARY classificator! Let's simplify the problem for now and only to identify one digit—for example, the number 5. This "5-detector" will be example of a binary classifier, capable of distinguishing between just two classes, 5 and not-5. Let's create the target vectors for this classification task:

```
y_train_5 = (y_train == 5) # True for all 5s, False for all other digits.
v test 5 = (v test == 5)
```

Multiclass/Multinomial Classification

And Introduction to Multilabel Classification

- Many classifiers are binary (HAM/SPAM)
- What to do for say a three category, like CAT/DOG/TURTLE problem?
- Divide into three CAT/NON-CAT, etc, binary classifiers and solve!
- Aka.: one-vs-rest/one-vs-all (OvA), one-against-all (OAA).
- Or the one-vs-one (OvO) method.
- NOTE: Multilabel classification is yet again differentity can categorize item into more classes, say both and DOG!
- ...and Multioutput/multilabel multiclass classificate

The Scikit-learn Fit-Predict Interface

Supervised Classification in practice

The API has one predominant object: the estimator.

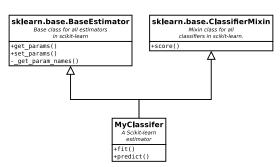

An estimator is an object that fits a model based on some training data and is capable of inferring some properties on new data. It can be, for instance, a classifier or a regressor.

All estimators implement the fit method: estimator.fit(X,y) All built-in estimators also have a set_params method, which sets data-independent parameters (overriding previous parameter values passed to $_init_$.

All estimators in the main scikit-learn codebase should inherit from sklearn, base, BaseEstimator.

The Scikit-learn Fit-Predict Interface

Python module and class function and member encapsulation:

- module private: one underscore
- class-private: two underscores

via mangled names.

...NOTE: no virtual void fit() = 0; declaration in python! ...for modules, private funs can still be accessed via a hack?!

...src file: /opt/anaconda3/pkgs/.../sklearn/base.py

The Scikit-learn Fit-Predict Interface

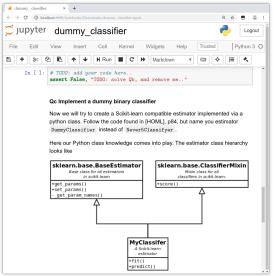

Demo..

Implementing an estimater via a python class as simple as

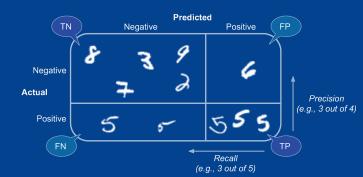

```
class ParadoxClassifier(BaseEstimator, ClassifierMixin):
    def fit(self, X, y=None):
        pass
    def predict(self, X):
        assert X.ndim==2
    return np.ones(X.shape[0],dtype=bool)
```

Exercise: L02/dummy_classifier.ipynb

A dummy classifier for the fit-predict interface, plus intro to a Stochastic Gradient Decent method (SGD) and introduction to the accuracy-paradox.

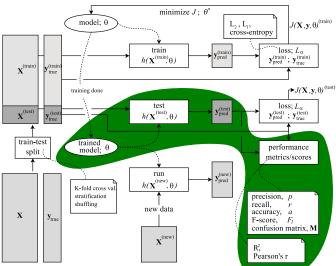

PERFORMANCE METRICS (SCORES)

Evaluér på test-data: Perfomance metrics

Kort intro til konceptet performance metrics..

 $NOTE_0$: Performance metric = score.

NOTE₁: 'Performance measure' begreb bruges ikke, kun score eller perf. metric. NOTE₂: Loss er ML algo'ens 'performance mål', score er vores evalueringsmål.

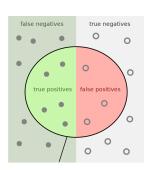

Nomenclature

For a binary classifier

| NAME | SYMBOL | ALIAS |
|-----------------|--------|---------------|
| true positives | TP | |
| true negatives | TN | |
| false positives | FP | type I error |
| false negatives | FN | type II error |

and $N = N_P + N_N$ being the total number of samples and the number of positive and negative samples respectively.

[https://en.wikipedia.org/wiki/Precision_and_recall]

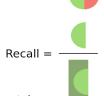

Precision, recall and accuracy, F_1 -score, and confusion matrix

precision,
$$p = \frac{TP}{TP+FP}$$
recall (or sensitivity),
$$r = \frac{TP}{TP+FN}$$
accuracy,
$$a = \frac{TP+TN}{TP+TN+FP+FN}$$

$$F_1\text{-score}, \qquad F_1 = \frac{2pr}{p+r}$$

| false negatives | true negatives | |
|-----------------|-----------------|--|
| • • • | 0 0 | |
| • | 0 0 | |
| true positives | false positives | |
| | 0 0 | |
| • • | 0 0 | |
| , | | |

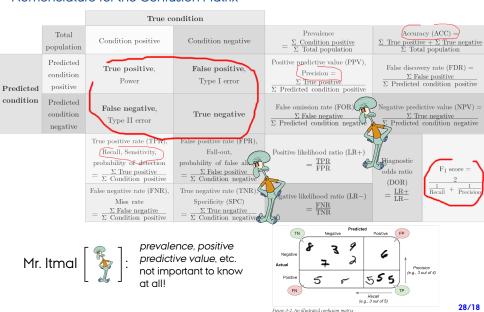

| Confusion Matrix, | | | | |
|-------------------|---------|--------|--------|--|
| | | actual | actual | |
| | | true | false | |
| predicte | d true | TP | FP | |
| predicte | d false | FN | TN | |

Precision =

NOTE₀: you can *compare* precision...*F*₁-score, but not necessarily the cost, *J*. NOTE₁: beware of matrix transpose and interpretation of *TP/TN*!

Nomenclature for the Confusion Matrix

Accuracy Paradox...

9

```
class ParadoxClassifier(BaseEstimator, ClassifierMixin):

def fit(self, X, y=None):

pass
def predict(self, X):
assert X.ndim==2
return np.ones(X.shape[0],dtype=bool)

Test via the breast cancer Wisconsin dataset...
```

rest via the breast cancer wisconsin dataset...

X_train, X_test, y_train, y_test =

NOTE₁: for MNIST, a dum classify not-as '5' $\sim a = 90\%$

```
train_test_split(
    X, y_true, test_size=0.2, shuffle=True, random_state=42

clf = ParadoxClassifier()
clf.fit(X_train, y_train)
y_pred = clf.predict(X_test)

random_state=42

prints: acc=0.6228070175438597,
N=114
```

```
score = clf.score(X_test, y_test)
print(f' clf.score()={score} (same as accuracy_score)')
NOTE<sub>0</sub>: for MNIST, a dum classify as '5' \sim a = 10\%
```

More on metrics, oh-so-many!

[https://scikit-learn.org/stable/modules/classes.html#sklearn-metrics-metrics]

| Classification metrics | |
|---|--|
| See the Classification metrics section of the user guide for furt | ther details. |
| metrics.accuracy_score (y_true, y_pred[,]) | Accuracy classification score. |
| metrics.auc(x, y[, reorder]) | Compute Area Under the Curve (AUC) using the trapezoidal rule |
| metrics.average_precision_score (y_true, y_score) | Compute average precision (AP) from prediction scores |
| metrics.balanced_accuracy_score(y_true, y_pred) | Compute the balanced accuracy |
| metrics.brier_score_loss(y_true, y_prob[,]) | Compute the Brier score. |
| metrics.classification_report(y_true, y_pred) | Build a text report showing the main classification metrics |
| metrics.cohen_kappa_score(y1, y2[, labels,]) | Cohen's kappa: a statistic that measures Inter-annotator agreement. |
| metrics.confusion_matrix(y_true,y_pred[,]) | Compute confusion matrix to evaluate the accuracy of a classification |
| metrics.fl_score (y_true, y_pred[, labels,]) | Compute the F1 score, also known as balanced F-score or F-measure |
| metrics.fbeta_score(y_true, y_pred, beta[,]) | Compute the F-beta score |
| metrics.hamming_loss(y_true, y_pred[,]) | Compute the average Hamming loss. |
| metrics.hinge_loss (y_true, pred_decision[,]) | Average hinge loss (non-regularized) |
| <pre>metrics.jaccard_similarity_score(y_true, y_pred)</pre> | Jaccard similarity coefficient score |
| metrics.log_loss(y_true, y_pred[, eps,]) | Log loss, aka logistic loss or cross-entropy loss. |
| metrics.matthews_corrcoef(y_true, y_pred[,]) | Compute the Matthews correlation coefficient (MCC) |
| metrics.precision_recall_curve(y_true,) | Compute precision-recall pairs for different probability thresholds |
| metrics.precision_recall_fscore_support() | Compute precision, recall, F-measure and support for each class |
